

XT-40S SMP Super Durable Polyester Premium Exterior Coil Coating System

Product Update: New and improved paint systems for Residential Steel Siding Products now available.

Klauer Manufacturing Company has implemented improvements to both the solid textured and printed textured paint specifications for all residential steel siding products we produce. The Roll forming and pronounced wood grain embossing process we subject our material to, requires a durable and flexible paint system. Klauer is committed to continual product reviews and research to apply the latest advancements in technology to our product offering.

The solid paint system, known as Klauer Classic, now utilizes an improved pretreatment process and primer that will enhance the flexibility and integrity of the coating. In addition, silicone has been added to the finish coat providing greater protection against scrapes and scuffs.

The printed system known as Klauer Prestige, like Klauer Classic now utilizes the improved pretreatment process and primer enhancing flexibility and film integrity. Silicone has been added to the top printed coat, again providing greater protection against scrapes and scuffs. And lastly, the chemistry between the base and printed coat has been altered to allow for better inter-coat adhesion, protecting the printed appearance under the harshest conditions.

All related warranties will remain intact and unchanged. There is no need to be concerned with mixing lots of old and new solid paint systems, color and appearance will not be affected. As always, lot numbers for printed material should not be mixed as the printing process is random and slight differences may be noticeable from lot to lot. All steel siding products, profiles, accessories and corresponding EMCO brand products manufactured by Klauer will be similarly affected by this change.
